TITLE : ELECTROSTATIC RECORDER

ABSTRACT : PURPOSE: To reduce the irregular density and irregular block density in a recorded picture regardless of the quantity of data.  
CONSTITUTION: When a picture signal given to an electrostatic recording head 13 is converted into data for electrostatic recording by a picture signal circuit 17, a period (t) selected sequentially to drive multi-stylus recording styluses and control electrodes divided into groups for the electrostatic recording head 13 is decided by a speed control circuit 18 based on time information required for data conversion and the time T required for recording by one line of the electrostatic recording head 13 based on the period (t) and a recording paper take-up motor drive circuit 19 is controlled so as to supply the recording paper to the electrostatic recording head 13 at the recording inversely proportional to the time T.
